

**AMENDMENTS TO THE SPECIFICATION:**

Please replace the paragraph beginning at page 20, line 20, which starts with "The default media selection parameters may be utilized if other methods of assigning ..." with the following amended paragraph:

The default media selection parameters may be utilized if other methods of assigning media selection parameters fail or cannot be utilized. For example, one method of assigning or selecting media selection parameters is the use of print client indicators such as a modality indicator, a network identity, a TCP port number, or a free-form text attribute. Illustratively, the print client indicator may be sent along with plurality of print parameters in a print job by a medical imaging device or a computing device. These print client indicators may be pre-defined on the multi-media printer 130. Alternatively, they may be user configurable at the multi-media printer 130. In one embodiment, the print client indicators may specify a media type or media size explicitly. Alternatively, the print client indicators may specify a job settings file, which may or may not include media selection parameters. Further discussion of the print client indicators is provided in the following patent application, the disclosure of which is incorporated herein by reference: application serial No. \_\_\_\_\_ (~~Attorney Docket No. 81174-306117~~) 10/719,871, entitled "Media Selection Method In a Multi-Media Printer Utilizing Print Client Indicators," filed concurrently herewith.

Please replace the paragraph beginning at page 21, line 11, which starts with "The default media selection parameters may also be utilized in conjunction with a sheet parameter, ..." with the following amended paragraph:

The default media selection parameters may also be utilized in conjunction with a sheet parameter, such as the coverage parameter. The coverage parameter or attribute may allow the print job to specify the particular area of the sheet to be used for rendering the print data of the print job. The coverage parameter or attribute may be included in the default parameters. Illustratively, the print job parameters may include standard coverage (print with 1/4" or 1" margins) or "full-bleed" coverage mode (print on entire physical sheet). Further discussion of the print sheet coverage parameter or attribute is provided in the following patent application, the disclosure of which is incorporated herein by reference: application serial No. 10/719,871 (~~Attorney Docket Number 81174-306117~~), entitled "Media Selection Method In a Multi-Media Printer Utilizing Print Client Indicators," filed concurrently herewith.
